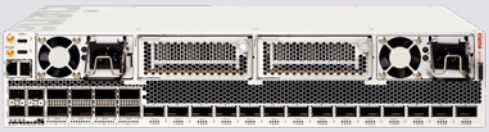
DATA SHEET

8110



Ciena's 8110 Coherent Aggregation Router is purpose-built for 100GbE services and aggregation. With dense 100GbE to 400GbE aggregation, support for 1/10/25GbE, and with the option of WaveLogic™ 5 Nano (WL5n), the 8110 addresses the increasing need for high capacity routing and switching applications.

Edge dynamics, 100GbE service delivery, and 400 Gb/s transport

Edge dynamics are driving bandwidth demand at unprecedented rates. These dynamics include annual growth by 5G Radio Access Network (RAN), even higher speed broadband, and enterprise requirements for cloud service growing at twice the rate of the others. As network operators get closer to their customers, the mix of connections and services—from 1GbE to 100GbE and 1/10/25GbE to 100GbE— are creating the need for 100GbE service delivery and aggregation to 400GbE.

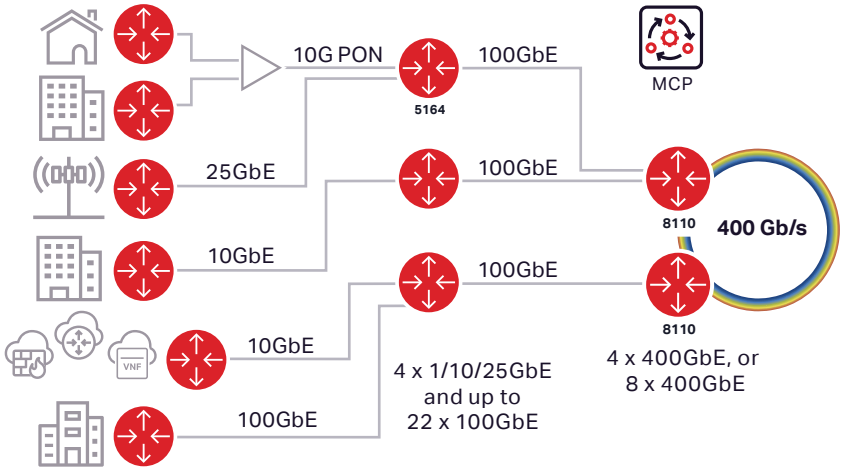


Figure 1. 8110 multi-edge aggregation

Features and benefits

- Temperature-hardened (-40°C to +65°C) for temperature-challenged or space-constrained locations
- Two flexible 800 Gb/s slots provide maximum port speeds and capacities at 100G, 200G, and 400G
- 4 x 1/10/25GbE, 22 x 100GbE fixed ports
- IP routing, SR-MPLS, Carrier Ethernet, and SRv6 ready
- Hardware-assisted routing and switching OAM scaled to deliver 100GbE services with guaranteed SLA differentiation
- SZTP for rapid, secure, and error-free turn-up of services
- Advanced synchronization, including built-in GNSS receiver
- Built-in RFC 2544 and ITU-T Y.1564 SAT with 100 Gb/s traffic generation and analysis
- SDN-ready next-generation management, including support for protocols such as NETCONF/YANG and gNMI/gRPC
- Ciena's MCP multi-layer support for end-to-end network management control and planning
- Redundant field-replaceable AC or DC power

The 8110's high-density 400G ports can provide significant savings in power, cooling, and transport costs. Video content and streaming giants have pushed cloud content closer to the customer, increasing the need for peering at the edge. With Adaptive IP™, network operators can easily terminate Provider Edge (PE) or route peer Provider (P) traffic for Internet Exchange Points (IXPs) and cloud providers on the 8110.

Dense, compact form-factor platform

Efficient use of real estate assets is a growing concern for network operators who either host their own network equipment or lease power and space in collocation facilities. As services multiply, operators have been forced to stack 10G-capable equipment, incurring additional collocation rental and power costs.

The 8110's sleek, shallow depth and 2.4 Tb/s of routing and switching capacity enable and facilitate cabinet and controlled environmental vault deployment. Extended temperature range support allows for installations in uncontrolled environments for outdoor aggregation of 100GbE, enabling high capacity at the outdoor edge.

Space is increasingly limited and expensive. Network operators face substantial capital expenditures to activate new locations or must retire active equipment to free space for new service delivery. Addressing bandwidth demand growth by deploying more and larger equipment is simply not a sustainable business model—economically or environmentally.

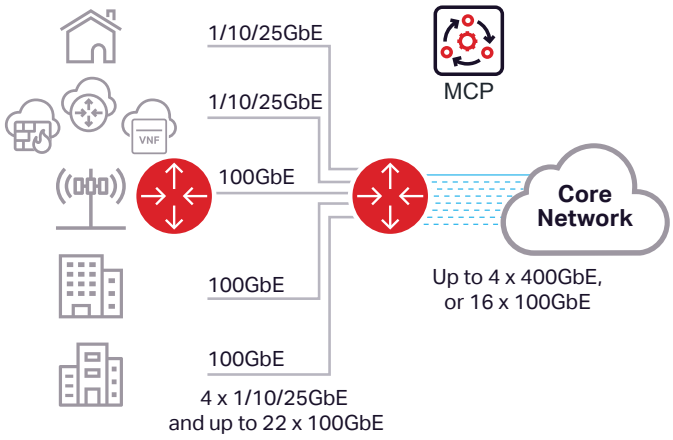

Figure 2. 8110 Router service and aggregation

Ciena's 8110 cost-effectively offers dense 100GbE service delivery in a 2RU fixed and modular form-factor with dual 800 Gb/s Field-Replaceable Units (FRUs), dual field-replaceable power supplies to minimize network downtime, and a variety of pluggable optics offering greater flexibility, including WL5n 400 Gb/s.

Edge content delivery

Video and cloud have pushed content closer to the customer, increasing the need for deeper peering while reducing the reliance on core 'Tier 1' interconnection markets. The 8110's deep packet buffers, large routing tables, and Internet Group Management Protocol (IGMP) version 3 capabilities enable localized peering at the metro and cloud on-ramp locations while improving the Quality of Experience (QoE) for users by reducing the latency to application sources.

Latency-aware traffic engineering

Bandwidth and latency are the two most impactful factors in the performance of applications. However, not all applications are affected by those two factors equally. As bandwidth and latency-oriented applications share a converged infrastructure, networks must provide a higher quality SLA with bandwidth awareness, latency awareness, and protection for performance shifts in the network.

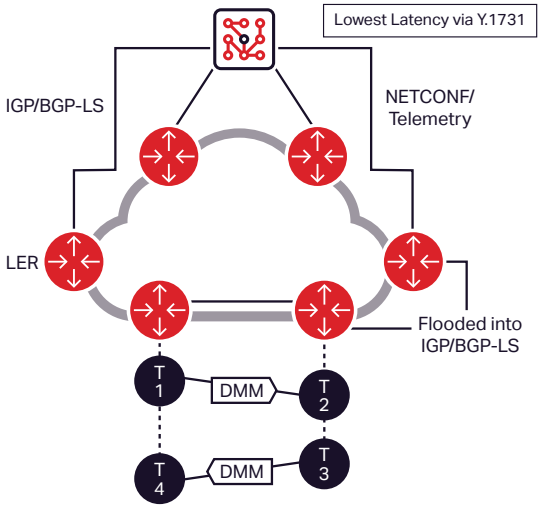

Figure 3. 8110 latency routing

Coherent aggregation routing

Ciena's 8110 provides two 800 Gb/s FRU slots. Either module slot can support Ethernet or coherent modules. The edge and metro networks are prime candidates for this IP/Optical architecture, adding packet collector rings and high-traffic routes between two routers. This is one resonating use case of Ciena's 'coherent aggregation portfolio' thus far.

Fine-grained SLA monitoring and enforcement

The 8110 includes performance benchmark testing based on ITU-T Y.1564 and RFC 2544, enabling end-to-end 1/10/25/100GbE line-rate traffic measurements across virtual circuits. This approach improves end-customer satisfaction by enabling operations personnel to proactively respond to network events via increased performance visibility for differentiated Service Level Agreement (SLA) reporting.

Advanced multi-layer protocol support

The 8110 supports a flexible selection of service offerings, including Layer 2 (L2) and Layer 3 (L3) services over a carrier-class, connection-oriented infrastructure using Multi-Protocol Label Switching (MPLS) and SR. The platform supports a rich suite of L2/L3 features with TDM, Ethernet, MPLS, MPLS LDP, Seamless MPLS, OAM, Sync, ACL, QoS, Network Slicing, IGP (IS-IS, OSPFv2), ISIS-SR, BGP/MP-BGP, LAG, FRR, TI-LFA, and SR functionality.

The 8110 operates as a full-featured IP router supporting NETCONF/YANG to easily integrate into an open Software-Defined Networking (SDN) environment with full visibility via streaming telemetry, and automated provisioning using open APIs.

Synchronization and timing

To realize the full benefit of Ethernet, MPLS, and IP, highly accurate time/phase synchronization, frequency synchronization, and even more stringent timing precision will be required.

New technologies, such as Time Sensitive Networking (TSN), have emerged as tools to provide these latency and jitter guarantees.

The 8110's rich timing and synchronization options—including support for IEEE 1588v2 and Global Navigation Satellite System (GNSS) receiver—enable new capabilities. These include Sync-as-a-Service with SLA for wholesale providers, soft network slicing, and additional applications like massive Machine-Type Communications (mMTC), URLLC, and native Ethernet services.

The cost-effectiveness and versatility of the 8110 Router provides synchronization and timing for many architectures with support for high-density 100GbE to 400GbE aggregation.

Differentiation through accelerated service velocity

Service velocity has become a critical competitive advantage for network, mobile, and wholesale operators. In many cases, service velocity is the determining factor in winning new service opportunities. The 8110 implements Ciena's unique Secure Zero-Touch Provisioning (SZTP) capabilities, allowing operators to deploy new packet-based services rapidly and securely in a fully automated manner. By reducing or eliminating costly and time-consuming manual intervention, provisioning errors are eliminated via SZTP. Most importantly, SZTP improves service deployment velocity and provides a significant competitive advantage.

Rich routing and switching OAM capabilities

As network operators and their customers increasingly rely on new IP/MPLS networks, providers must maintain guaranteed service levels. Networks must support a broad array of routing and switching Operations, Administration, and Maintenance (OAM) capabilities to ensure operators can proactively and reactively maintain and report on the ongoing health of their networks and delivered services. The 8110 also supports a comprehensive set of hardware-assisted routing and switching OAM capabilities and is architected to provide SLA metrics and OAM at a high scale. This enables operators to take full advantage of the port density and 2.4 Tb/s full-duplex fabric for delivering the maximum number of services at the lowest cost. Additionally, the 8110 has an embedded line-rate Service Activation Test (SAT) engine (RFC 2544, ITU-T Y.1564), with traffic generation to a full 100 Gb/s to guarantee strict, market-differentiating SLAs, without relying on costly external test equipment and the highly trained personnel that requires.

Simplified multi-layer management and control

Ciena's MCP domain controller offers a unique and comprehensive solution for the administration of mission-critical networks that span access, metro, and core domains, and provides unprecedented multi-layer visibility from the photonic to the data layers. With this innovative management approach, MCP supports a programmable and automatable solution that provides a fully open approach to installing, manipulating, and monitoring service behaviors in an SDN environment.

Technical Information

Interfaces

Fixed Ethernet Ports

- 22 x 100GbE QSFP28 ports
- 4 x 1/10/25GbE SFP28 ports
- 2 x 800G Module Slots:
  - 8 x 100GbE QSFP28
  - 2 x 400 GbE QSFP-DD
  - 2 x 400 GbE CFP2-DCO

Other

- 1 x USB-C Off-switch memory
- 1 x USB-C Console
- 1 x RJ45 Time-of-Day (ToD + 1PPS in/out)
- 1 x SMB Phase input (1pps or 10MHz in/out)
- 1 x SMB GNSS antenna
- 1 x RJ45 Management (MGMT)

Ethernet

- IEEE 802.1D MAC Bridges
- IEEE 802.1p Class of Service (CoS) prioritization
- IEEE 802.1Q VLANs
- IEEE 802.1ad Provider Bridging (Q-in-Q) VLAN full S-VLAN range
- VLAN tunneling (Q-in-Q) for Transparent LAN Services (TLS)
- Layer 2 Control Frame Tunneling
- IEEE 802.1ax Link Aggregation (LAG): Active/ Active; Active/ Standby
- IEEE 802.3ad Link Aggregation Control Protocol (LACP)
- Jumbo frames up to 9216 bytes
- IEEE 802.3-2018 IEEE Standard for Ethernet and supporting following rates
  - IEEE 802.3z-1998 Gigabit Ethernet
  - IEEE 802.3ab-1999 1000Base-T via copper SFP
  - IEEE 802.3ae-2002 10Gb/s
  - IEEE 802.3ba-2010 100Gb/s
  - IEEE 802.3by-2016 25Gb/s
  - IEEE 802.3bs-2017 200Gb/s

Carrier Ethernet OAM

- EVC Ping (IPv4)
- IEEE 802.1ab-2006 Link Layer Discovery Protocol (LLDP)
- IEEE 802.1ag-2007 Connectivity Fault Management (CFM)
- IEEE 802.3ah-2004 EFM Link-fault OAM
- ITU-T Y.1564 Ethernet Service Activation Test Methodology up to 100GbE
- ITU-T Y.1731 Performance Monitoring
- RFC 2544 Benchmarking Methodology for Network Interconnect Devices Generation and Reflection at up to 100GbE

Synchronization

- External Timing Interfaces (1pps in or out, 10MHz in or out)
- ITU-T G.703 Frequency in or out (10MHz)
- ITU-T G.703 1pps and ToD in or out
- Integrated GNSS receiver (GPS, Galileo, GLONASS, Beidou, QZSS)
- ITU-T G.8262/G.8264 SyncE EEC option1 and option2
- ITU-T G.8275.1 Full and Assisted Full Timing support T-GM, T-BC and T-TSC
- ITU-T G.8273.2 Class C
- ITU-T G.8275.2 Partial and Assisted Partial Timing Support T-GM, T-BC, and T-TSC
- ITU-T G.8273.4 Class B
- Stratum 3E oscillator
